SHEEP GENETICS

HISTORY

THE "Gleneith" Border Leicester Stud was originally established by Fred Kember Snr in 1922. However official Breed Society registration was not sought until 1932 (F665). The stud grew from small beginnings to around 400 ewes being put to the rams in 1944. In 1948 with the death of Fred Kember Snr. the flock slipped from registration. Fred Kember Jnr. purchased the flock from the estate in 1950 and had the flock re-registered with the same prefix of "Gleneith" but with the current flock number (F1929).

Fred Jnr continued breeding Border Leicesters with ewe numbers generally between 300-400. He regularly took his show team to the local shows and also showed at the Albury Sheep Show, which was held in the old Wool Store and then for a few years at the Albury Show Ground. In 1995 the stud incorporated all family members with Will and Wes continuing the stud tradition. Nathan is now the fifth generation of the Kember family to be actively involved in all areas of stud management and in 2004 we held our inaugural on property sale.

\$Superborder\$ is the brand name for high performing Border Leicesters that have been bred in quality stud flocks and are ranked above average for the breed by Lambplan. The \$Superborder\$ name is trademarked so that only sheep bred to strict standards may be sold as \$Superborder\$. To qualify to be a \$Superborder\$ ram they must have an index above the breed average on August 15th run date and meet individual EBV cut off gates.

THE DOLLAR INDEX

The Border Leicester Dollar index is the standard index used for assessing Border Leicester sheep. This index stands alone and cannot be compared with other indices used in other breeds. This index combines a ram's EBV's according to the actual dollar value of the progeny's extra growth, extra fertility and better carcass quality. This index allows for the fact that 50% of the 1st cross performance comes from the Border ram. An index of 100 is given as the average for the breed when recording first started. Every point above 100 indicates \$1 extra income from each ewe joined.

An index of 110 indicates that the ram will produce \$10 extra lamb value for every ewe joined. In a working lifetime of 4 years, a ram will produce 200 progeny, the extra value by that ram is \$10 times 200 = \$2000.

HEALTH STATUS

Gleneith Stud has obtained OJD MN3v status and all our rams have been vaccinated with Guidar vaccine and are approved vaccines. We are Ovine Brucellosis Accredited Free Flock and Foot Rot Free.

PAGE 1

STUD RAMS

Any ram within the sale catalogue can be purchased as a stud ram, with the following criteria.

- A minimum price of \$1500 will apply to a ram purchased as a stud ram
- Must be notified to the auctioneer on the fall of the hammer.

KEY

BT: Birth Type, single twin or triplet

BWT: Birth Weight

MWWT: Maternal weaning weight; related to milking ability of the female progeny

WWT: Weaning weight; (with MWWT relevant to the sucker industry)

PWWT: Post weaning weight; a good indicator of the lamb's ability to grow after weaning to market weights

PFAT: Post weaning fat

PEMD: Post weaning eye muscle depth

YGFW: Yearling greasy fleece weight

NLW: Number of lambs weaned

INDEX: Sum total of all of the above, collated to a general lamb/ first cross index.

\$: Signifies \$uperborder\$

Acc: Accuracies for EBVs as a percentage

 Shaded box represents top 10%

LAMBPLAN EBV's are calculated from raw data collected by breeders and accredited LAMBPLAN operators. LAMBPLAN does not oversee or audit the collection of this data and therefore neither LAMBPLAN nor Meat and Livestock Australia accept any responsibility for the accuracy of the data. LAMBPLAN EBV's are designed to give the best possible estimate of true genetic merit from that data, i.e., the estimate that maximises the correlation between EBV's and true genetic merit. EBV's can only be compared between flocks or between management groups within a flock when a pedigree link exists and that link is used.
